this volume presents a review of the latest numerical techniques used to identify
ligand binding and protein complexation sites it should be noted that there are
many other theoretical studies devoted to predicting the activity of specific
proteins and that useful protein data can be found in numerous databases the
aim of advanced computational techniques is to identify the active sites in
specific proteins and moreover to suggest a generalized mechanism by which
such protein ligand or protein protein interactions can be effected developing
such tools is not an easy task it requires extensive expertise in the area of
molecular biology as well as a firm grasp of numerical modeling methods thus
it is often viewed as a prime candidate for interdisciplinary research

in this study a procedure for predicting the number of passes of a wheel load that will cause a specified rut depth is developed using information which includes the base layer thickness the resilient moduli and general classification of the granular base course and the subgrade soils the procedure is mechanistic but simple and is based on the permanent deformation characteristics of various types of soils determined in the laboratory and also from test results published by other researchers resilient moduli of pavement material layers are obtained from the results of non destructive testing techniques the validity of predictions of a number of these techniques is verified by comparing them with laboratory test results parametric runs were made using the mechano lattice program to form a database of rut depths

field and design engineers in power distribution describe practical experience in maintaining power distribution systems and in extending their power handling capacity cost and long term economic factors of power line maintenance are discussed safety of maintenance and of failures are the design issues considered
